

IDECSI Personal Security Guardian

Meet Paul, CISO.

His executives have become fans of cyber security.

Secure Office 365

Is your Email, SharePoint or OneDrive compromised ?
Is every access expected ? Is all sharing legitimate ?
What is the impact of potential breaches ?

Multi-application intelligent solution for real-time monitoring and audit

IDECSI provides a comprehensive solution for Office 365 protection - Exchange, OneDrive, SharePoint - and other leading enterprise applications.

IDECSI is built on two pillars :

1. A radical new model of collaborative security that offers each user the means to monitor their security and participate in the defence of the company.

2. The use of advanced technology for monitoring and detection: machine learning, behaviour analysis and context-aware analysis.

The solution protects applications, data and users by monitoring access, permissions and sharing. It immediately detects any malicious or suspicious activity.

Activated in three simple steps

PHASE 1

AUDIT AND SELF-LEARNING

As soon as it is installed, IDECSI performs a flash analysis on the access logs and the system configuration and builds a precise picture of the current status: access, permissions and sharing. Which rights are configured? Who can access which accounts? What access modes are used? Which devices are synchronised? Which rules are set? This initial review reveals critical vulnerability concerns and ensures the health of the system.

PHASE 2

PERSONALISED PROTECTION AND DETECTION

Once the first phase of diagnosis is completed, IDECSI generates individual profiles for each user. The solution can subsequently identify dangerous activity with

very high accuracy when it occurs. Real-time protection guarantees the integrity of access, settings and sharing 24/7.

PHASE 3

COLLABORATIVE SECURITY

When an alert is issued, it can be sent to the CISO, the SIEM and / or SOC. Thanks to IDECSI's Personal Security Guardian, alerts can also be communicated directly to users via a mobile application. Users have the means to monitor their own security, validating suspicious actions, or highlighting breaches. This approach hugely increases detection capacity, significantly reduces time to resolution, and ensures the security team focuses only on real breaches.

Users protect themselves, they protect the company: the revolution of the Personal Security Guardian

Monitoring and Alerting : dedicated interfaces for users and security teams

PERSONAL SECURITY GUARDIAN FOR END USERS

Each user has visibility to the security of their data and contributes to the protection of the company. IDECSI creates a channel of communication allowing users to control access to their applications and communicate with the security team.

A customied security dashboard

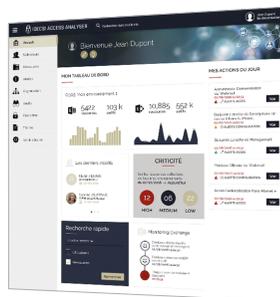

Users can check their application security in one click including recent access, location of access, sharing, configuration, and more. They can easily identify and report any unauthorised activity.

Continuous protection: individual and collaborative

The IDECSI Personal Security Guardian application is available on Apple and Android mobile devices and alerts users in the event of unauthorised access or configuration changes that introduce vulnerabilities. Users respond to the alerts, reporting any breach the moment it occurs.

FOR THE SECURITY TEAM / SOC - A COMPLETE CONTROL INTERFACE

Immediately view permissions, devices, delegations and access. Launch audits for one or more accounts in one click. Process and resolve all malicious activity, illegitimate access and suspicious reconfiguration when it occurs. The IDECSI solution is integrated with the major SIEM solutions and other service platforms to provide a single pane of glass for security management.

Key features

Real-time detection of unauthorised access, sharing and malicious configuration

Risk repositories provide up-to-date security throughout the life of each protected application

Personalised protection:
Self-learning behaviour analysis and individual user profiles

User-centric smartphone application to engage with users

Platform does not require access to sensitive data or administrative rights

Installation in less than two hours

Available in SaaS, Hybrid or On-Premise
